STANDARD SPRINGS

Contents in the Spring Catalogue

Wave springs - Multi-coil wave springs are made from flat spring material and are suitable for use in applications where a low mounting dimension is required. A reduction in mounting dimension of up to 50% can be achieved.

Compression springs - a large selection of the most common standards in the European market. Also contains tool springs according to ISO 10243.

Extension springs - unique program with special loops and two standard dimensions which provide a wide selection. Most of the parts are available as stainless options.

Torsion springs - both single and double torsion springs in a range that covers most applications. All parts are available in stainless steel.

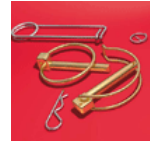

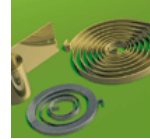

Disc springs - the range is based on the European Standard DIN 2093, supplemented by a large assortment of stainless steel disc springs.

Spiral springs - motor springs, clock springs, constant force springs and assemblies for slideway and saddle assembling.

Locking springs, circlips, retainer rings, locking washers, pins, spring u-nuts and clips - contains a wide range of the most common locking components.

Gas springs - a complete range of springs with strokes from 20 up to 500 mm. Most models are available in stainless steel. Our range is unique in offering models with adjustable force and integrated safety locks.

End fittings - loops, clevises, ball cups and brackets in different designs. Most of them are available in stainless steel.
